Sickness absence and disability pension among privately employed white-collar workers

Background

Most studies about sickness absence or disability pension have either been general studies of the entire labour market, or focused on those occupational groups or branches of industry with high sickness absence rates. This means that the scientific knowledge about sickness absence among privately employed white-collar workers is very limited. In order to take effective actions, basic knowledge about sickness absence patterns among different groups of white-collar workers is needed.

We conduct both prospective and cross-sectional cohort studies on all those who were privately employed white-collar workers in 2012 (N=1 283 516), 2018 (N=1 421 813), respectively. Moreover, we conduct further in-depth analyses of a subgroup of those, that is white-collar workers in the trade and retail industry 2012 (N=192 077), generally and with a special focus on the trade and retail industry. The project is based on Swedish register data.

The overall aim of the project is to

- Generate knowledge about sickness absence and disability pension among privately employed white-collar workers.

Regular meetings with representatives from Alecta, PTK, Unionen, the Swedish Trade Federation and the Confederation of Swedish Enterprise facilitates collaboration with users of the research outside academia.

Project participants

Kristin Farrants, Ph.D., ass. prof., *PI*
Kristina Alexanderson, Ph.D., professor
Niklas Gustavsson, statistician
