PERCEPTION/COGNITION/  
SENSATION

METHODOLOGY

RECOMMENDATIONS TO  
ALLEVIATE TACTILE  
SENSITIVITY

RECOMMENDATIONS TO  
ALLEVIATE VISUAL  
SENSITIVITY

RECOMMENDATIONS TO  
ALLEVIATE AUDITORY  
SENSITIVITY

# OUTLINE

# Who? Why?

## In the United States

- Autism Spectrum Disorders (2020 - CDC) 1 in 54
  - 1 in 34 boys
  - 1 in 144 girls

# Research Methods

- Sensory Integration Theory
- 800+ Participants
- Product Research
- fMRI technology/Virtual Reality
- Interviews/Observation
  - Three Studies
- Surveys
  - Three Studies

# DESIGN FOR INCLUSION

Low Clutter Stimuli; NT > ASD

Direct Sunlight Stimuli; NT > ASD

# TACTILE DESIGN CONSIDERATIONS

PERSONAL  
SPACE

PRESSURE

TEMPERATURE

PHYSICAL  
ACTIVITY

SOFT & SMOOTH  
TEXTURES

NATURE

Tactile (Touch)	Touches people and objects unnecessarily; Has abnormally high pain threshold (does not appear to be hurt after a hard fall) Does not appear to feel extreme temperatures	Avoids wearing certain fabrics; Becomes distressed during grooming; Does not like being wet or going barefoot; Reacts negatively to being touched
-----------------	--	---

# PERSONAL SPACE

- A variety of small group seating arranged at right angles, which include high backs, and upholstered seats provide a cocooning affect.
- Allow for private spaces
- Provide adequate room to transition through the environment without touching people
- Break-out spaces in classrooms

# TEMPERATURE

## BALANCE HEAT AND HUMIDITY

- Finding a balance in **temperature** may be challenging for individuals with SPD, and quick **temperature** changes can be alarming.
- Heat and humidity may create the need to cool off through separation of others
- Heat may also increase unpleasant bodily odors

# FEEL

- ***Soft*** bedding, pillows, blankets are preferred
- ***Smooth*** metallic surfaces more positive reaction than rough metallic surfaces
- Preference for ***smooth*** shiny surfaces in interiors

# PRESSURE

## PRESSURE

Design factors related to sensory issues for children with TD.

- Size Fit Issues
- Fabric fiber contents
- Myth of one unified design for various children with TD.
- Expensive but may not relieve tactile sensitivity

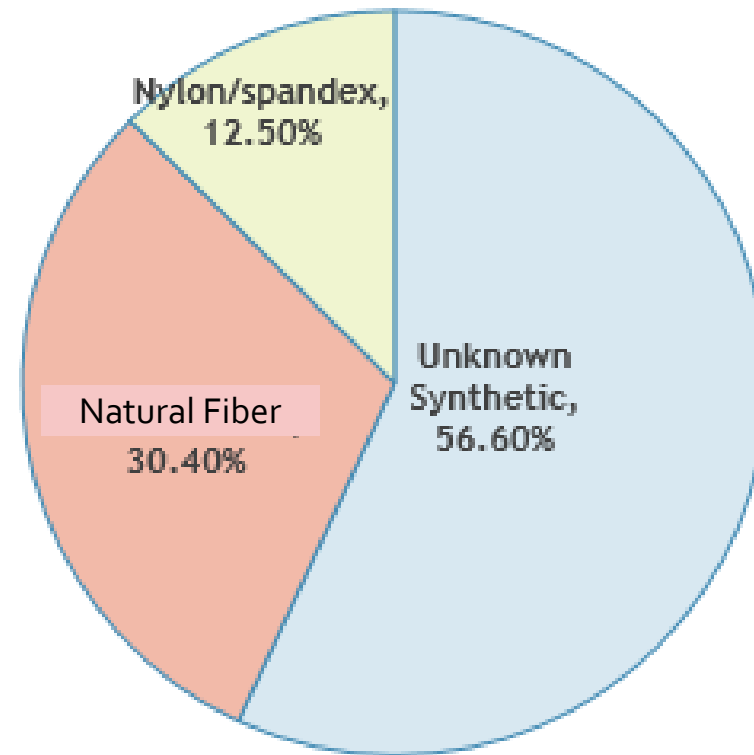

## SOFT & SMOOTH

### Fabrics related to Tactile sensitivity

- Clothing with certain textures may create undesirable noise
- Children often complain about discomfort of clothing.
- Of the therapy clothing, 69.57% were made of synthetic fibers
- Only 30.43% were natural fiber (e.g. cotton, wool).

## SENSORY CLOTHING

- Temperature Control
- Soft & Smooth
- Pressure

# SENSORY CLOTHING

# ACTIVITY

# NATURE

## Benefits of Outdoor Time for Children's Development

- **Socio-Emotional Development:**

- Reduced stress
- Promotes self-confidence
- Improves social relations

- **Physical Development:**

- Reduces myopia
- Increased physical activity
- Gross and fine motor skills
- "Safe" risk taking
- Opportunities to use all senses

- **Cognitive Development:**

- Greater attention spans
- More exploration than indoors
- Creativity
- Opportunities to explore curiosity

# VISION

LEGIBILITY

PREDICTABILITY

BOUNDARY

FLEXIBILITY

TRANSITION

HIDDEN

## Visual (Sight)

Disregards people or objects in environment, can see only outlines of certain objects, likes bright colors and bright sunlight

Bothered by bright lights (covers eyes or squints);  
Easily distracted by movement; Stares at certain people or objects

# LEGIBILITY

## THROUGH COLOR

Color is one of the most influential aspects of an environment with both psychological and physiological reactions

- Physiological & Psychological Effects
- Saturation/Intensity
- Hyposensitive
  - Bright Colors
  - High Contrast
- Hypersensitive
  - Subdued
  - Blues & Greens
- Color-Coding communicates purpose

# LEGIBILITY

## THROUGH PATTERN

### Design Recommendations

- Visual patterns that are not boring, but not overwhelming.
  - Avoid high contrast patterns, for example black & white.
  - Use rhythm & pattern to organize the space.
- 
- Helps code a space to communicate with the complex mind, breaking it down into parts that make up a whole
  - Spatial Queuing through patterns and colors assist in spatial comprehension (Grandin, 1996).

# BOUNDARY

PROVIDING GUIDANCE

Boundaries communicate where an activity or space begins or ends.

- Are they clear?
- Opaque versus clear
- Minimize visual distractions
- Avoid large open areas
- Use flooring, furniture, screens and color to communicate boundaries
- Combination of visual cues and physical boundaries

# BOUNDARY

# PREDICTABILITY

ALLEVIATE STRESS & INSTILL CONFIDENCE

- Design considerations for **predictability**:
  - Organize elements in a predictable manner. Symmetry.
  - Straightforward and easy to navigate.
  - Spatial Sequencing: Associating a specific space with a correlated activity.
  - Furnishings and architectural details can communicate the purpose and
  - Clear sight lines
  - Landmarks to trigger previous memories of the space.
  - Compartmentalization – a purpose for each space.
  - Change can create stress.

# PREDICTABILITY

# FLEXIBILITY

FOR UNIQUE NEEDS

- Accommodates individual unique needs.
- Grants control over the environment.
- A space can be flexible and compartmentalized simultaneously.

HIDDEN

# AUDITORY

LAY-OUT

CONSTRUCTION

MATERIALS

MUSIC

CONTROL

PREDICTABLE

<i>Sense</i>	<i>Hypo-sensitive</i>	<i>Hyper-sensitive</i>
Auditory (Sound)	Does not respond when name is called; Enjoys strange noises; Enjoys making loud, excessive noises	Overly sensitive to loud noises; Appears to hear noises before others; Cannot function well with background noise

# PREDICTABILITY

ALLEVIATE STRESS & INSTILL CONFIDENCE

- Prepare for sudden or unexpected noises
- “Muffle” loud speakers
- Design spaces for intended use
- Provide opportunities to promote social engagement
- Provide Safe Spaces
- Build Tolerance to unexpected noises

# CONTROL

- Design for privacy
- Provide choice and autonomy
- Smaller, subdivided furniture arrangements
- Escape Spaces
- Sensory spaces
- Operable windows

# LAY-OUT

## ZONING, ADJACENCIES, TRANSITION AND BUFFER SPACES

- Consider the level of sound spaces typically produce
- The desired level of sound for tasks
- Example: a noisy gym located next to a classroom is not ideal. Similarly, the play room and sensory integration space are located on the noisier side of the home
- Placement of noisy rooms
- Locate the closet and/or bathroom on the corridor wall as a sound buffer

# CONSTRUCTION

- Ceiling height
- Wall construction
- Windows
- Lighting
- Avoid direct passageways or connections between classrooms
- Stagger doors along a hallway
- Increase the amount of insulation
- Shape and location of duct work
- Location of air handling units

# MATERIALS

Select sound absorbing materials

- Specify carpet instead hard flooring
- Wood products also tend to have more absorptive properties than many laminates
- Drapery Panels
- Acoustical Panels

# MUSIC

- Soft background music can reduce the impact of excessive auditory stimulus.
- Using headphones blocks out excess noise or allows for listening to preferred music
- Auditory integration: listening to digitally modified music through headphones to help auditory hyper-sensitive adaptation
- Nature sounds

# MUSIC

## CONCLUSION

The goal of these recommendations is not to create a “bubble” for individuals with sensory integration issues but to help them learn to cope with the environment.
